

Agent Reach: Quick Reference

github.com/lllTheGodlll/Agent-Reach (fork of Panniantong/Agent-Reach, v1.5.0) · Set up once, use in every project

What it is, in plain words

Your AI agent can already browse a little, but sites like YouTube, Twitter/X, Reddit and Bilibili each need their own tool, login or workaround. **Agent Reach is an installer and health checker:** it picks the most reliable tool for each site, installs it, and checks it still works. It also gives Claude Code a **skill** (a cheat sheet Claude reads automatically) so Claude knows which command to run when you paste a link or ask it to research something.

The skill goes in `~/Claude/skills/agent-reach/`. Claude Code reads that folder in **every project**, so you install once per computer, not once per repo.

Step 1: Install on your computer (once)

Need a Python tool installer first (skip if you already have `uv` or `pipx`):

```
brew install uv
```

Run the setup script. It installs the `agent-reach` command and `yt-dlp`, sets up web search (Exa), and installs the English skill for Claude Code:

```
curl -fsSL https://raw.githubusercontent.com/lllTheGodlll/500-AI-Agents-Projects/claude/amazing-bohr-1z7a2a/agent-reach-setup/setup-agent-reach.sh | bash
```

Optional, unlocks GitHub issues/PRs/forks (public repos already work):

```
gh auth login
```

Check what's working:

```
agent-reach doctor
```

Step 2: Cloud sessions (Claude Code on the web)

Cloud containers are wiped after every session, so the install has to run each time. The environment's **Setup script** does it automatically for every repo that uses that environment.

1. Open the cloud environment menu in the session title bar → **Edit**.
2. **Setup script:** paste the contents of `agent-reach-setup/setup-agent-reach.sh`.
3. **Network access:** choose **Full**, or **Custom** and add `r.jina.ai`, `mcp.exa.ai`, YouTube, `api.bilibili.com`, `www.v2ex.com`, `xueqiu.com`. The default policy blocks all of these.
4. Start a new session. You'll see the `agent-reach` skill.

Everyday use

You don't need to remember commands. Just ask Claude, and the skill tells it what to run:

You say to Claude	What runs under the hood
"Read this page: <url>"	<code>curl -s "https://r.jina.ai/URL"</code> (page → clean text)
"Search the web for X"	<code>mcpporter call exa.web_search_exa query="X" numResults=5</code>
"What does this YouTube video say?"	<code>yt-dlp --write-auto-sub --skip-download URL</code> (subtitles)
"Find popular repos for X"	<code>gh search repos "X" --sort stars</code>
"What are people saying on Twitter about X?"	<code>twitter search "X" -n 10</code> (needs cookies)
"Search Bilibili for X"	<code>bili search "X" --type video</code>

Command you run	What it does
<code>agent-reach doctor</code>	Status of every channel and which tool serves it
<code>agent-reach check-update</code>	Is a newer version out?
<code>agent-reach install --system --channels=twitter</code>	Add an optional channel
<code>agent-reach configure twitter-cookies</code>	Save login cookies (hidden input)

Short workflow recap

1. `brew install uv` (once).
2. Run the setup script (once per computer; re-run it to upgrade).
3. `agent-reach doctor` to see what's ready.
4. For cloud sessions: paste the script into the environment's Setup script and allow network access.
5. Open any project and just ask Claude to read, search or summarize.

Useful extras

Optional channels (only set up what you use)

Channel	How to unlock
Twitter/X	<code>agent-reach install --system --channels=twitter</code> , then Cookie-Editor browser extension → Export → Header String → <code>agent-reach configure twitter-cookies</code>
Reddit / Facebook / Instagram / XiaoHongShu	<code>agent-reach install --system --channels=opencli</code> + the OpenCLI Chrome extension (uses your logged-in browser)
Podcast transcripts	<code>agent-reach configure groq-key</code> (free key at console.groq.com)
Everything	<code>agent-reach install --system --channels=all</code>

Use a secondary account for cookie-based logins. Platforms can ban accounts that use automated access, and cookies give full account access.

Update, uninstall, where files live

Upgrade everything: re-run the `curl ... | bash` line from Step 1.

```
agent-reach skill --uninstall      # remove the skill from Claude Code
uv tool uninstall agent-reach     # remove the command
```

Config and cookies: `~/.agent-reach/` · Skill: `~/.claude/skills/agent-reach/` · Nothing is written into your projects.

Troubleshooting

- **Doctor output is in Chinese:** normal, it's the only language. The skill Claude reads is English.
- **A  channel still fails:** doctor doesn't live-test every site. In cloud sessions it's usually the network policy (HTTP 403 "CONNECT tunnel failed").
- **Exa says "OAuth authorization required"** in the cloud: the network is blocking `mcp.exa.ai` . Allow it.
- **Fork out of date:** click **Sync fork** on GitHub, or install upstream with `AGENT_REACH_SOURCE=git+https://github.com/Panniantong/Agent-Reach` .
